

# SMRT™ TASK TRAINER - ANKLE FRACTURE

STRATEGIC MEDICAL RESEARCH & TRAINING™

Falls and Motor Vehicle accidents can lead to significant orthopedic trauma. The SMRT™ Ankle Fracture Moulage Task Trainer is a hyper-realistic wound featuring durable bone molded from CT images of a distal tibial spiral fracture. The Trainer creates realistic examples of high impact trauma, or as a component of a multi-trauma patient training scenario.

The innovative and wearable SMRT™ Moulage Task Trainers from Strategic Medical Research & Training™ create an unmatched experience of realism featuring realistic moulage and active bleeding across a wide spectrum of woundings and interventions. Made with durable materials and designed for a "one size fits most" range of limb and body sizes, the SMRT™ Moulage Task Trainers are engineered to work with live role players as well as to augment existing simulation systems—while allowing flexibility in placement and utilization. All SMRT™ Moulage Task Trainers work with SMRT™ Trauma Tables, SMRT™ Bleeding Systems, and common hydration systems, making them standalone and ready to use, while also allowing ease of integration into existing training systems. Utilized by Military, Law Enforcement, EMS, and Hospitals to create unsurpassed realism in hemorrhage control training, SMRT™ Training Aids are realistic, cost effective, highly mobile, durable, and low maintenance.
